
Spin calibration: hand-written models vs the exploration trajectory (dashed = per-case floor of each model class)
(a) the trajectory through model space
(b) the same, in pass order
hand-written, single regime (7-13 coef, at or near their class floor)
Rink et al. 2024
pass 43: 1PA theory clock, falls back to the hand-written level
energy_anchored_spin
fluxanchored_spin
pn_anc_spin_physical
junction_spin
flux_anc_spin_with_orbit
pn_anchored_spin
pass 5-6: second regime (ppBHPT-clock merger blend)
installed form (FLUX), per-case floor
climb: +coefficients (passes 6-21)
hand-written split (inspiral | merger, 14 coef)
two-regime form (M2), per-case floor
prune: 16 -> 12 (pass 49b)
condense: 34 -> 18 coef at constant error (passes 21-40)
two-regime + spline shapes, per-case floor
training $\mathcal{E}$ (T96 median)
fitted coefficients
hand-written
flux_anc_spin_with_orbit (9 coef)
running best
